

Services We Provide

A detailed overview of what we can build and deliver for you.

01 Web App Development

Interactive, browser-based applications built for performance and scale.

We design and develop web applications that go beyond static websites — fully dynamic systems where users can log in, interact with data, and perform real actions. Whether it's a project management tool, a client portal, a booking platform, or a SaaS dashboard, we build it with a modern tech stack that handles real traffic. Our web apps are built with clean architecture from the start — separating the frontend interface from the backend logic so the system is easy to maintain, extend, and scale as your user base grows. We handle everything from the database design to the final deployment.

- Custom dashboards & portals
- Real-time features (notifications, live updates)
- Role-based access & user management
- Responsive design for all screen sizes
- Scalable backend with REST API

02 Website Development

Professional websites that load fast, look great, and represent your brand.

Your website is often the first impression a potential client or customer has of your business. We build websites that are visually sharp, technically solid, and optimized for search engines. Whether you need a corporate site, a portfolio, a blog, or a multi-page business presence, we handle the full process. We focus on performance — fast load times, clean HTML/CSS, and mobile-first design. Every website we build is structured so your team can manage content easily, without needing to call a developer every time you want to update a page.

- Mobile-first responsive design
 - SEO-optimized structure & metadata
 - Fast page load performance
 - CMS integration for easy content updates
 - Custom domain & hosting setup
-

03 App Development

Native and cross-platform mobile apps for iOS and Android.

We build mobile applications that feel natural on any device. From consumer-facing apps to internal business tools, we handle the full mobile development lifecycle — from wireframes and UI design to app store submission and post-launch support. We build for both iOS and Android, using cross-platform approaches where speed matters and native development where performance is critical. Our apps are designed with the end user in mind — clean flows, fast interactions, and reliable offline behaviour where needed.

- iOS & Android support
 - Push notifications & real-time sync
 - Offline-first capabilities
 - Secure authentication (biometric, OAuth)
 - App Store & Play Store deployment
-

04 MVP Build (End-to-End)

Go from idea to live product as fast as possible — without cutting corners.

Most founders don't need a perfect product on day one. They need a working one. We help you identify the core features that matter, cut everything else, and ship a version of your product that real users can interact with. We run a structured discovery process first — understanding your target user, the problem you're solving, and the minimum feature set needed to test your assumptions. Then we design, build, and deploy. A typical MVP with us takes 4 to 8 weeks depending on complexity. By the end, you have something real to show investors, users, or clients.

- Idea validation & feature scoping
 - UI/UX design included
 - Full backend & frontend build
 - Deployed & live at launch
 - Post-launch iteration support
-

05 Product Discovery & Scoping

Clarity before code — define exactly what to build and why.

Many projects fail not because of bad execution, but because of unclear direction. Product discovery is the process of getting aligned on what you're building before a single line of code is written. We run structured sessions to understand your users, map out the problem space, prioritize features using proven frameworks like MoSCoW, and produce a clear technical specification. You leave with a roadmap, a defined scope, and confidence that the build is headed in the right direction.

- User research & persona mapping
 - Feature prioritization (MoSCoW)
 - Technical architecture planning
 - Timeline & cost estimation
 - Delivery roadmap document
-

06 UI/UX Design

Interfaces people actually enjoy using — beautiful, intuitive, and purposeful.

Good design is not decoration. It is the difference between a product users love and one they abandon after two minutes. We approach design by starting with the user — understanding how they think, what they need, and where they get confused. We produce wireframes, user flow diagrams, and high-fidelity mockups before any development begins. This means the team knows exactly what to build, and you can review and adjust the experience before it becomes expensive to change.

- User flow mapping
 - Low & high-fidelity wireframes
 - Interactive prototypes (Figma)
 - Design system & component library
 - Handoff-ready files for developers
-

07 Frontend Development

Pixel-perfect, fast-loading interfaces built from your designs.

We take design files and turn them into real, working interfaces. Every component is coded for responsiveness, accessibility, and performance. We use modern frameworks and keep the code clean and maintainable so future updates are easy. We pay close attention to the details that matter — smooth transitions, correct spacing, consistent typography, and behaviour that matches what users expect. The result is a frontend that looks exactly like the design and works flawlessly across devices and browsers.

- React / Next.js development
 - Responsive across all screen sizes
 - Accessible & keyboard-navigable
 - Optimized for Core Web Vitals
 - Integrated with backend APIs
-

08 Backend Development

The engine behind your product — reliable, fast, and built to scale.

The backend is everything users don't see but entirely depend on. We build backend systems using Python and FastAPI — handling your business logic, data storage, background processing, and API layer with clean, well-tested code. We design systems that are easy to extend. Whether you need to add a new feature, handle more users, or integrate a new service, a well-structured backend makes that straightforward rather than painful.

- Python & FastAPI architecture
 - PostgreSQL database design
 - Authentication & authorization
 - Background tasks with Celery & Redis
 - Comprehensive API test coverage
-

09 **Full-Stack Development**

One team, one codebase — frontend and backend delivered together.

Rather than splitting your project across multiple vendors, we handle the entire stack. This means faster communication, tighter integration between layers, and a product that works as a coherent system rather than a collection of disconnected parts. From the user interface down to the database, we own the full build. This reduces friction, speeds up delivery, and means there is a single point of accountability for the entire product.

- Unified frontend & backend delivery
 - Consistent API contract across layers
 - Shared authentication & session handling
 - End-to-end testing coverage
 - Single team for all technical decisions
-

10 **AI System Integration**

Add intelligent features to your product using the latest AI models.

AI is no longer a future technology — it is a practical tool available right now. We integrate language models like OpenAI's GPT or Anthropic's Claude into your existing product or new build, adding features that would have been impossible or enormously expensive to build just a few years ago. This could mean a smart search experience, an AI writing assistant, automatic document summarization, classification pipelines, or intelligent recommendations. We handle the prompt engineering, API integration, context management, and output validation.

- OpenAI & Claude API integration
 - Prompt engineering & optimization
 - Context window management
 - Streaming responses for real-time feel
 - Fallback handling & error management
-

11 **SaaS Product Development**

Subscription-based software products built for recurring revenue.

SaaS products have specific requirements that go beyond a standard web app — subscription billing, plan-based feature access, multi-tenant architecture, usage tracking, and customer lifecycle management. We have experience building all of these from scratch. We help you design the right pricing model, implement the billing infrastructure, and build the onboarding experience that converts trial users into paying customers. The result is a product ready to generate recurring revenue from day one.

- Multi-tenant architecture
 - Stripe subscription billing
 - Plan-based feature gating
 - User onboarding & activation flows
 - Usage analytics & churn monitoring
-

12 E-commerce Development

Online stores built to sell — fast, secure, and easy to manage.

We build e-commerce platforms tailored to your products and customers. Whether you are selling physical goods, digital products, or services, we design the purchase flow to minimize friction and maximize conversions. Our e-commerce builds include product catalogue management, cart and checkout flows, payment gateway integration, order management, and inventory tracking. We build custom solutions when off-the-shelf platforms like Shopify don't fit your needs.

- Product catalogue & inventory system
 - Stripe / PayPal payment integration
 - Cart, checkout & order management
 - Discount codes & promotions engine
 - Admin panel for store management
-

13 CMS Development

Give your team control over content — no developer required.

A content management system lets your marketing or operations team update the website, publish blog posts, manage products, or edit any content — without touching code. We build or integrate CMS solutions that fit exactly how your team works. We can build a headless CMS integrated with your existing stack, or configure a platform like Sanity, Strapi, or Contentful. Either way, the result is a system your non-technical team can use confidently on day one.

- Headless CMS integration (Sanity, Strapi)
 - Custom admin panel development
 - Rich text editing & media management
 - Role-based editorial access
 - API-driven content delivery
-

14 Landing Page Design & Development

High-converting pages built for launches, campaigns, and lead generation.

A great landing page has one job — to convert visitors into leads, signups, or customers. We design and build landing pages with that singular focus. Every element, from the headline to the call-to-action, is crafted to communicate your value clearly and drive action. We work fast. Most landing pages are live within a few days. We build on Webflow, Framer, or custom HTML/CSS depending on your needs, and we can connect forms to your CRM, email platform, or backend.

- Conversion-focused layout & copy structure
 - Webflow / Framer / custom HTML build
 - Form integration with CRM or email tools
 - A/B testing setup
 - Page speed optimized for Google ranking
-

15 **Brand Identity & Logo Design**

A visual identity that makes your product instantly recognizable.

Before people use your product, they see it. Your logo, colors, typography, and visual language form the first impression. We create brand identities that are distinctive, professional, and built to work across every touchpoint — from your website to pitch decks to social media. We deliver a complete brand package including logo variations, a defined color palette, typography guidelines, and usage rules. Everything is provided in formats ready for both digital and print use.

- Logo design (multiple concepts)
 - Color palette & typography system
 - Brand guidelines document
 - Social media asset templates
 - Files in all required formats (SVG, PNG, PDF)
-

16 **API Design & Development**

Clean, well-documented APIs that other systems can reliably connect to.

APIs are the connective tissue of modern software. We design REST APIs that are intuitive, consistent, and well-documented — making it straightforward for your frontend, mobile app, or third-party services to integrate. We follow industry best practices for API design: clear endpoint naming, proper use of HTTP methods, versioning, authentication, rate limiting, and comprehensive error responses. Every API we build ships with documentation so any developer can start using it quickly.

- RESTful API design & implementation
 - OpenAPI / Swagger documentation
 - API versioning & backward compatibility
 - Rate limiting & abuse protection
 - Authentication via JWT or API keys
-

17 **Database Architecture**

Data structures designed for reliability, performance, and growth.

A poorly designed database becomes a major problem as your product grows — slow queries, data inconsistencies, and migrations that break things. We design database schemas from the start with your data access patterns in mind. We work primarily with PostgreSQL and design normalized schemas, appropriate indexes, foreign key constraints, and query-optimized structures. For products with specific needs, we also advise on when to introduce caching layers or search engines.

- PostgreSQL schema design
 - Index strategy for query performance
 - Data normalization & integrity constraints
 - Migration planning & versioning
 - Query optimization & performance review
-

18 Cloud Infrastructure Setup

Production-ready cloud environments configured correctly from day one.

Getting your infrastructure right early prevents expensive problems later. We configure cloud environments on AWS, Railway, Render, or your preferred provider — setting up compute, managed databases, object storage, environment variables, and networking. We apply security best practices from the start: principle of least privilege, encrypted secrets management, private networking between services, and monitoring setup. The result is an environment that is ready for real traffic and easy for your team to maintain.

- Cloud provider setup (AWS, Railway, Render)
 - Managed database configuration
 - Environment & secrets management
 - Static file & media storage (S3)
 - Uptime monitoring & alerting
-

19 DevOps & CI/CD Pipeline

Automated deployments so shipping code is safe, fast, and repeatable.

Manual deployments are slow and risky. A CI/CD pipeline automates the process — every time code is pushed, tests run automatically, and if they pass, the new version is deployed to the right environment without manual intervention. We set up pipelines using GitHub Actions that cover linting, automated testing, Docker image building, and deployment to staging and production. The result is a development workflow where your team ships confidently and frequently.

- GitHub Actions pipeline setup
 - Automated test execution on every push
 - Docker build & container registry
 - Staged deployment (dev → staging → production)
 - Rollback strategy on failed deployments
-

20 Performance Optimization

Make your existing product faster, cheaper to run, and more reliable.

Slow applications lose users. High infrastructure costs eat into margins. We audit your existing system to find bottlenecks — slow database queries, unoptimized API responses, excessive memory usage, or frontend assets that are too large. We then implement targeted fixes: query optimization, caching strategies with Redis, CDN configuration, lazy loading, and code profiling. We measure before and after so you can see the concrete improvement.

- Database query profiling & optimization
 - Redis caching layer implementation
 - CDN setup for static assets
 - API response time benchmarking
 - Frontend bundle size reduction
-

21 Security Audit

Identify vulnerabilities before attackers do.

Security issues in production are expensive — in reputation, in legal liability, and in user trust. We review your application systematically for common vulnerabilities: SQL injection, broken authentication, insecure direct object references, exposed secrets, misconfigured permissions, and more. We produce a prioritized report of findings with clear remediation steps. For critical issues, we can implement the fixes directly. This is particularly valuable before a major launch, funding round, or enterprise client onboarding.

- OWASP Top 10 vulnerability review
 - Authentication & session security audit
 - Secrets & environment variable inspection
 - Dependency vulnerability scanning
 - Prioritized remediation report
-

22 Legacy System Migration

Move from outdated technology to a modern stack — without downtime.

Older systems accumulate technical debt, become expensive to maintain, and eventually block new feature development. Migration is not just rewriting code — it is a careful process of understanding what exists, planning the transition, and executing in phases to avoid disruption. We assess your current system, map data flows and dependencies, design the target architecture, and migrate incrementally. This approach keeps the business running throughout the process and reduces the risk of a big-bang cutover.

- Current system audit & dependency mapping
 - Target architecture design
 - Phased migration planning
 - Data migration with validation
 - Zero-downtime cutover strategy
-

23 Third-Party Integrations

Connect your product to the tools and services your business depends on.

Modern products rarely work in isolation. They send emails, process payments, trigger SMS messages, sync with CRMs, push analytics events, and connect to dozens of other services. We handle all of these integrations reliably. Whether it is Stripe for payments, Twilio for messaging, HubSpot for CRM, Slack for notifications, or a custom partner API, we integrate it cleanly into your backend — with proper error handling, webhook management, and retry logic.

- Payment gateways (Stripe, PayPal)
 - Communication APIs (Twilio, SendGrid)
 - CRM integrations (HubSpot, Salesforce)
 - Webhook handling & event processing
 - OAuth-based third-party authentication
-

Chatbot & Virtual Assistant

AI-powered conversational tools that work for your business 24/7.

A well-built chatbot does not frustrate users — it genuinely helps them. We build AI-powered assistants that understand natural language, draw on your product's data, and provide accurate, useful responses. These can be customer support bots that handle common queries and escalate complex ones, onboarding assistants that guide new users through your product, or internal tools that help your team retrieve information quickly. We build on top of LLMs and connect them to your knowledge base or database.

- LLM-powered natural language understanding
 - Knowledge base & document integration
 - Escalation to human agents
 - Chat history & context management
 - Embeddable widget or API endpoint
-

Automation & Workflow Systems

Eliminate repetitive manual work with reliable automated processes.

Time spent on repetitive tasks is time not spent on work that matters. We build automation systems that handle recurring processes — data syncing between systems, scheduled report generation, automatic file processing, notification workflows, and more. We use Python, task queues, and scheduling tools to build automations that are robust, observable, and easy to maintain. Every automation we build includes logging and alerting so you know immediately if something goes wrong.

- Scheduled task automation
 - Cross-system data synchronisation
 - File & document processing pipelines
 - Email & notification automation
 - Error logging & failure alerting
-

Data Dashboard & Analytics

Turn your raw data into clear, actionable insight.

Data is only valuable when people can understand it. We build internal dashboards that visualize the metrics your team actually cares about — user growth, revenue trends, operational KPIs, or any other business data. We connect directly to your database or data warehouse, build the query layer, and create clean, readable visualizations. The result is a tool your team opens every morning to understand how the business is performing.

- Custom metrics & KPI visualization
 - Real-time & historical data views
 - Role-based access to different reports
 - Export to CSV / PDF
 - Integration with PostgreSQL, BigQuery, or Redshift
-

Technical Consulting & Advisory

Expert guidance to help you make the right technical decisions.

Not every technical challenge requires a full build. Sometimes you need an experienced engineer to review your current approach, help you choose the right technology, or validate that your architecture will hold up as you scale. We offer focused consulting engagements — typically a few hours to a few days — where we deep dive into your specific situation and give you concrete, actionable recommendations. This is particularly valuable before a major technical investment or when something is not working and you are not sure why.

- Architecture review & recommendations
 - Tech stack selection guidance
 - Scalability & performance assessment
 - Build vs. buy analysis
 - Written recommendations report
-

Code Audit & Refactoring

Clean up technical debt and make your codebase maintainable again.

Code that was written quickly, by multiple people, or without a clear structure becomes increasingly expensive to work with over time. Bugs are harder to find. New features take longer to build. Developers spend more time understanding the code than writing it. We audit your codebase systematically — identifying areas of high complexity, duplicated logic, missing tests, security issues, and architectural problems. We then refactor the most impactful areas, leaving the codebase cleaner, better tested, and easier to extend.

- Code complexity & duplication analysis
 - Test coverage assessment & improvement
 - Architectural pattern improvement
 - Dependency update & security patching
 - Documentation of key system components
-

Post-Launch Support & Maintenance

Ongoing technical support to keep your product healthy after launch.

Launching is not the end — it is the beginning. Real users behave in ways you did not anticipate. Bugs appear. Infrastructure needs tuning. Features need iteration. We offer ongoing support engagements to handle all of this. We monitor your application, respond to incidents, release bug fixes, and implement improvements based on user feedback. Having a reliable technical team available after launch means you can focus on growing the product rather than managing technical fires.

- Uptime monitoring & incident response
 - Bug fixes & hotfix releases
 - Security patch management
 - Performance monitoring
 - Monthly technical health reports
-

30 Technical Documentation

Clear, accurate documentation that makes your system understandable.

Good documentation is an investment in every future developer who works on your product — including you, six months from now. We write documentation that explains how your system works, how to set it up, and how to use your APIs. This includes API reference documentation, system architecture diagrams, developer onboarding guides, and runbooks for operational procedures. Well-documented systems are easier to hand off, easier to maintain, and more credible to enterprise clients and investors.

- API reference documentation (OpenAPI)
 - System architecture diagrams
 - Developer onboarding guide
 - Operational runbooks
 - Inline code documentation review
-

31 Team Augmentation

Senior engineering capacity added directly to your existing team.

Sometimes you have a team but need more capacity — for a specific project, a product push, or to cover a gap. We embed with your existing engineering team as senior backend engineers, working within your processes, tools, and codebase. This is faster and more flexible than hiring. We are productive from day one, require minimal onboarding, and can scale involvement up or down based on what the project needs.

- Immediate availability — no ramp-up delays
 - Works within your existing tools & workflows
 - Senior-level Python backend expertise
 - Flexible engagement — part-time or full-time
 - Knowledge transfer at end of engagement
-

32 Proof of Concept (PoC) Build

Test a critical assumption quickly before committing to a full build.

Before investing months of development into an idea, it is worth testing whether the core technical or product assumption actually holds. A Proof of Concept is a minimal, focused build designed to answer one specific question — does this work? We scope PoCs tightly, build only what is needed to validate the hypothesis, and deliver results quickly — typically within one to two weeks. The output is either confidence to proceed with the full build, or valuable learning that prevents a much larger mistake.

- Single hypothesis focus
 - Minimal scope — built to learn, not to ship
 - Delivered in 1–2 weeks
 - Technical feasibility assessment included
 - Clear recommendation on next steps
-
